TOKEN ARCADE - DOCUMENTATION INDEX

Status: Active documentation map
Release: Metropolis v0
Revision: 8 Oct 2026 alignment pass
Purpose: Tell every human/Codex agent what is authoritative, what is implementation guidance, and what is research evidence.

---

1. THE THREE LABELS

Token Arcade uses exactly three document labels.

SOURCE OF TRUTH

Authoritative product/protocol decisions.

Only two documents currently carry this label:

A. Product / Application Source of Truth

`Token_Arcade_v0_Metropolis_Handoff.pdf`

Owns:

- Token Arcade v0 product definition
- Guest / Player / Creator / Admin logic
- Privy + Player Passport UX
- linked ownership-wallet model
- Game Cartridge host boundary
- Gameplay Skeleton vs Cabinet/Deployment terminology
- per-Cabinet leaderboard identity
- Free Play / Ranked Run / Community Raid product behavior
- Game Registry
- Submit -> Admin Approve -> Developer Deploy lifecycle
- Creator / Arcade Portal and Admin Review Console
- UI/UX principles
- current Cabinet mapping
- Metropolis demo sequence
- branch/workstream plan
- scope cuts
- post-v0 product roadmap

If the question is **"What should the user/product do?"**, this document wins.

B. Protocol / Economy Source of Truth

`minicoin-economy-v0.2.2-codex-ready.pdf`

Owns:

- MiniCoin definition
- Community Asset definition
- MiniCoinFactory
- Uniswap v4 pool configuration
- MiniCoinHook
- WMON hook-fee behavior
- FeeAccumulator
- EconomyManager / Economy Router
- Strategy architecture
- PrizeVault
- RaidManager
- VaultThreshold trigger
- Funded vs Economy Raids
- score-verification/settlement trust boundary
- LP lock and migration constraints
- treasury routing
- v0 economic invariants
- contract threat model / guardrails
- Monad / Uniswap deployment references
- protocol-specific open questions

If the question is **"How should contracts, money, liquidity, fees, rewards, or raid funding behave?"**, this document wins.

No chat message, old prompt, gap report, game repo, or agent-generated plan may silently override either Source of Truth.

IMPLEMENTATION NOTE

Working guidance for a specific task, branch, game, adapter, or integration.

Current examples:

- `cartridge-kit-v0.3.zip`
- `CODEX_GAME_INTEGRATION_ATTACK.md`
- game-specific gap reports
- technical spikes
- UI component notes
- score-verifier implementation notes

Implementation Notes explain **how to build** a Source-of-Truth decision.

They may be revised or discarded without redefining Token Arcade.

If an Implementation Note conflicts with a Source of Truth, the Source of Truth wins.

RESEARCH NOTE

Evidence, references, experiments, comparisons, protocol docs, and observations.

Examples:

- Monad docs
- Uniswap v4 docs
- Privy docs
- Delegate docs
- Skrumpeys research
- Remix.gg research
- third-party protocol comparisons
- security postmortems
- live-game audits

Research Notes do **not** become product decisions merely because they are true or interesting.

If research proves a Source-of-Truth assumption impossible or incorrect, flag the conflict for founder resolution. Do not silently rewrite the architecture.

---

2. CONFLICT RULE

The two Sources of Truth govern different layers.

If implementation reveals a contradiction:

1. Stop the conflicting work.
2. Quote the exact conflicting requirements.
3. Identify which layer owns each requirement.
4. Do not invent a bridge or new product decision.
5. Ask for founder resolution.
6. Update the owning Source of Truth before continuing.

Examples:

- **Can a game exist without a MiniCoin?** Product Handoff owns the UX; Economy Spec owns the economic implications. Both say yes.
- **Does reusing a Skeleton reuse the leaderboard?** Product Handoff: no. Leaderboards belong to Cabinet deployments.
- **How does a MiniCoin fee reach a PrizeVault?** Economy Spec.

- **Who sees Deploy after a game is approved?** Product Handoff: the developer/creator.
- **Who holds unrestricted Factory authority in v0?** Economy Spec; the product Deploy action must respect that protocol boundary.
- **Must every Raid-ready game support deterministic replay?** No. Product/Economy sources use a game-specific Score Verifier boundary; replay is one verifier type.

---

3. CURRENT PRODUCT IDENTITY RULES

These are already reflected in the Product Source of Truth and are repeated here only as navigation aids:

- **Gameplay Skeleton** = reusable mechanics/rules.
- **Cabinet / Deployment** = the public game instance in Token Arcade.
- Separate Cabinets made from the same Skeleton get separate `gameId`s, leaderboards, Raid histories, community associations, and optional economies.
- The Player Passport may aggregate a player's history across Cabinets.
- A reskin may create a new public Cabinet identity while preserving the scored gameplay path.
- If scored mechanics change, it is a new gameplay/Cartridge version, not merely a skin.

---

4. CURRENT METROPOLIS CABINET MAP

Initial seeded/deployed Cabinets

- **eMONAD-branded Cabinet** - built from the Buy Bounce source/Skeleton; eMONAD community association; public title can be finalized independently of the source repo name.
- **Two Places at Once** - associated with Skrumpeys; preserve the existing game; no broad reskin required.
- **Coindle** - COIN/RWA concept; game remains live with economy unavailable/Coming Soon.
- **Skip to 10K** - ETH/WETH concept; no reskin; do not invent an unverified bridged WETH path.

Hero new submission

- **Skrumpey Slide** - intentionally withheld from the initial legacy import so it can prove the real `Submit -> Admin Approve -> Developer Deploy`

-> Published pipeline.

---

5. DECISION HIERARCHY

```
TOKEN ARCADE
|
|-- SOURCE OF TRUTH
|   |-- Product: Token_Arcade_v0_Metropolis_Handoff.pdf
|   `-- Protocol: minicoin-economy-v0.2.2-codex-ready.pdf
|
|-- IMPLEMENTATION NOTE
|   |-- cartridge-kit-v0.3.zip
|   |-- CODEX_GAME_INTEGRATION_ATTACK.md
|   `-- branch/game-specific implementation notes
|
|-- RESEARCH NOTE
|   `-- external docs, audits, comparisons, experiments
|
`-- CODE
    `-- implementation of the decisions above
```

Code is not permission to redefine the product.

If code and documentation disagree, first determine whether:

- the code is stale,
- an Implementation Note is stale,
- a Source of Truth needs an explicit founder-approved revision,
- or a real unresolved conflict exists.

Then act accordingly.

---

6. V0 BUILD PRIORITY

For Metropolis, optimize for the smallest credible end-to-end product.

Application/cartridge path:

```
Registry
-> initial published Cabinets
-> Guest plays
-> Player Account / Passport
-> Ranked result through game-specific Score Verifier
-> Creator submits Skrumpey Slide
```

```
-> Admin approves
-> Developer deploys
-> Skrumpey Slide appears automatically
```

Economic path:

```
MiniCoin
-> Pool
-> Hook fee
-> FeeAccumulator
-> EconomyManager
-> PrizeVault
-> VaultThreshold
-> RaidOpened
-> verified competition result
-> settlement / claim
```

Do not build roadmap systems at the expense of those paths.

---

7. METROPOLIS SCOPE RULE

Before adding anything, ask:

> Does this materially improve the end-to-end Metropolis demo, fix a security/correctness issue, or prevent an architectural dead end?

If **no**, defer it.

In particular, do not opportunistically add:

- permissionless creator launches
- AI game generation
- multiplayer platform infrastructure
- advanced DynamicFeeStrategy
- automated NFT floor buying
- broad multichain deployment
- `$TA`
- betting / wagering
- marketplace systems
- full cosmetics marketplace
- clan / sprint systems
- shared Skeleton-wide leaderboards

unless the founder explicitly changes scope.

---

8. CODEX WORKING RULE

Before starting a task, identify:

Label: Source of Truth / Implementation Note / Research Note
Layer: Product / Protocol / Implementation / Research
Owning source: exact document
Acceptance test: observable behavior proving completion
Out of scope: what must not be redesigned

For application/game work:

```
The game supplies gameplay.
Token Arcade supplies the arcade.
```

For protocol work:

```
Hook captures/accounting.
Economy Router allocates.
Strategies act.
Vault holds.
Trigger decides when it is game time.
RaidManager settles the tournament economy.
```

---

9. CHANGE CONTROL

When a major product or economic decision changes:

1. Update the owning Source of Truth first.
2. Increment its revision/version if appropriate.
3. Add a short changelog entry.
4. Update affected Implementation Notes.
5. Then update code.

Do not let architecture drift through isolated chat messages or agent-generated files.

---

10. NORTH STAR

The Internet Is Fun.

Games first.
Wallets when useful.
Identity persists.
Competition is obvious.
Communities feel represented.

Economics remain modular.
Strategies remain auditable.
Metropolis ships before the roadmap eats it.
